

Link to an external DSL C/C++ function

digexfun - Interface

PowerFactory

digexfun_* .dll

The diagram illustrates the `digexfun_* .dll` interface. It shows a large rectangle containing four function prototypes, each preceded by `void __stdcall`:
`void __stdcall FunctionName1(void)`
`void __stdcall FunctionName2(void)`
`void __stdcall FunctionName3(void)`
`void __stdcall FunctionName4(void)`

C / C++ Interface

Function must be registered in userfun.cpp:

```
int __stdcall RegisterFunctions(int ifun, char* cnam, int* iVersion)
{
    if (ifun == 0) {
        strcpy(cnam, "myselect");
        *iargc = 3;
    } else if (ifun == 1) { // function index
        strcpy(cnam, "FunctionName1"); // new function name
        *iargc = 3; // number of arguments
    }
}
```

Function Prototype:

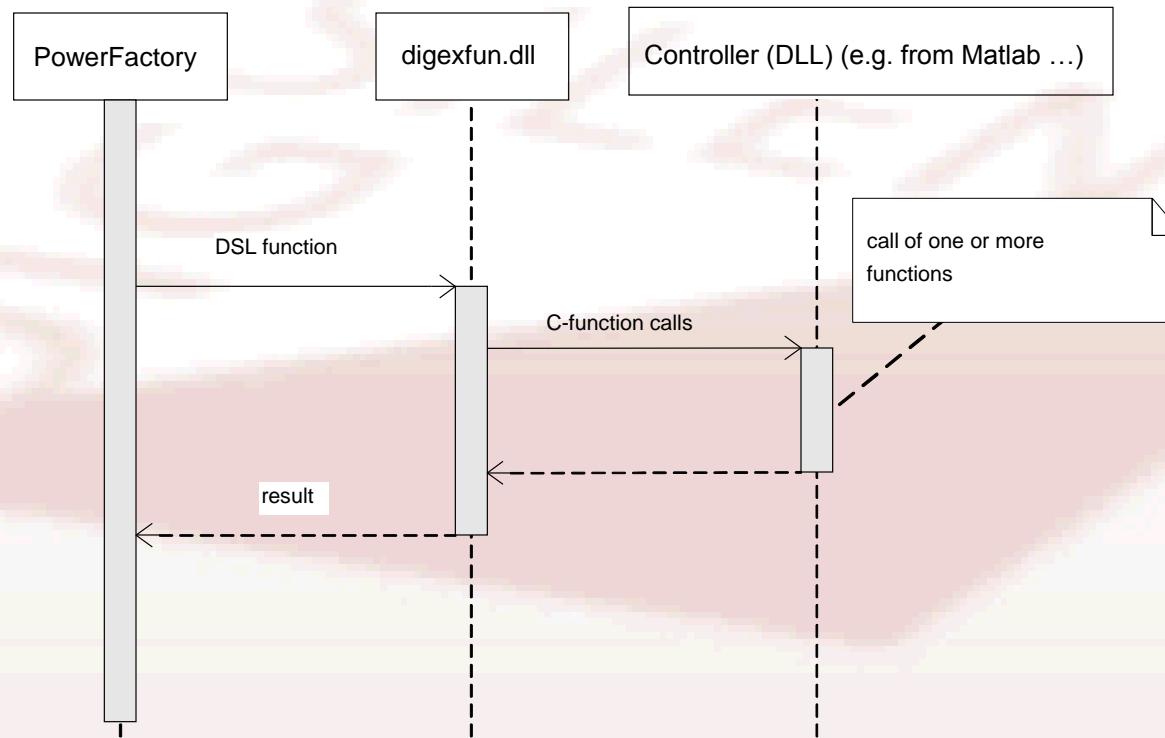

```
void __stdcall FunctionName1(void)
```

Returning a value:

call push(value1) at the end of the function

Access to the function arguments => use pop()

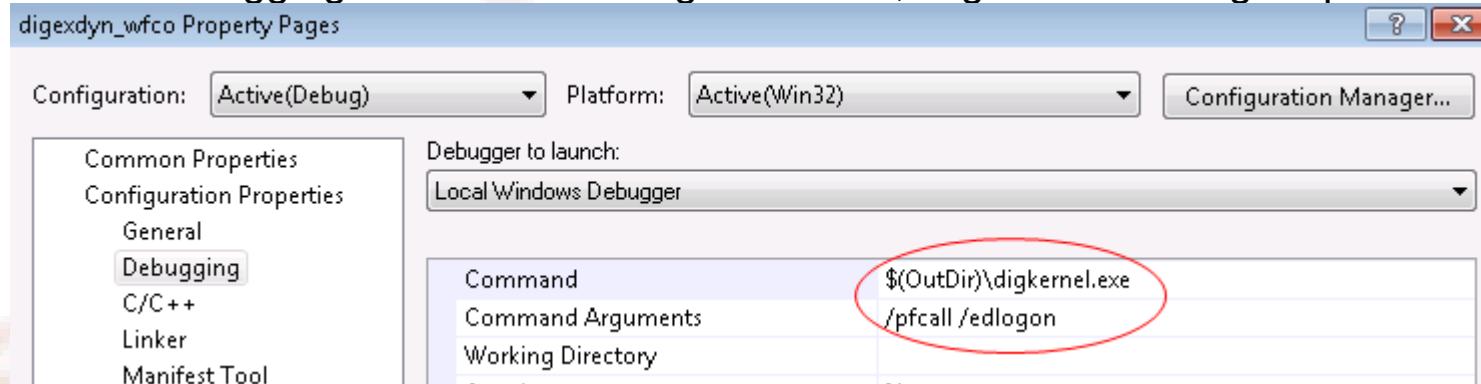

C-Interface -> Controller DLL

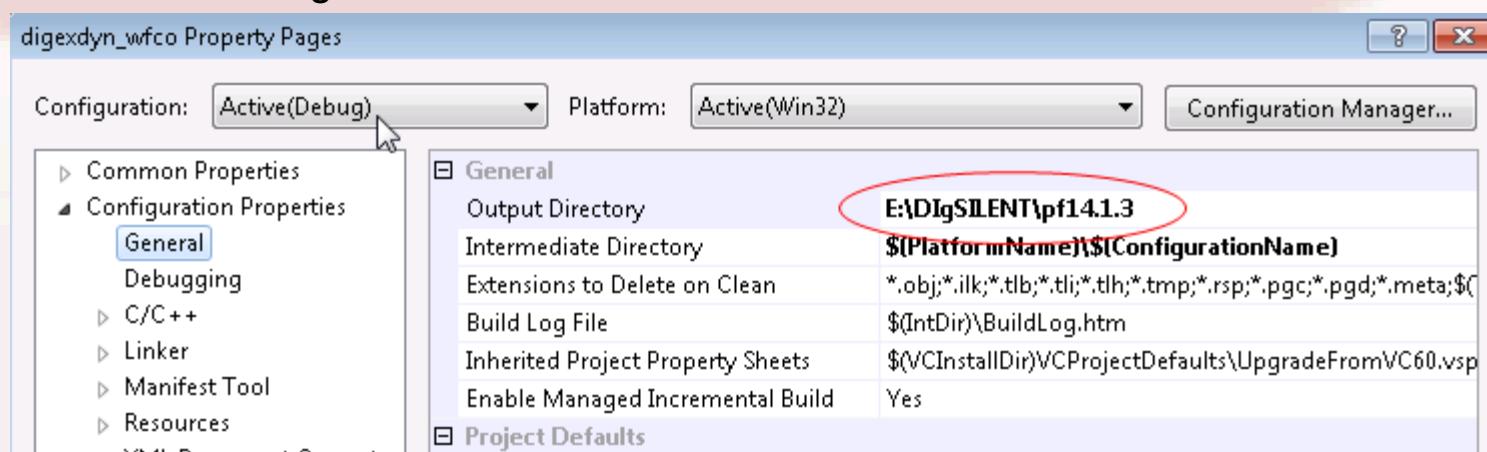

Visual Studio Settings

- Microsoft Visual Studio 6.0, 2005, 2008 or Express Edition

- ◆ For debugging => Command: digkernel.exe, Arguments /edlogon /pfcall:

- ◆ Linker Settings

digexfun external functions

- `RegisterFunctions(int ifun, char* cnam, int* iVersion) :`
To register the external c function (called from PowerFactory)
- `get_wrk_path () :`
To get the PowerFactory installation directory e.g. „e:\DIgSILENT\PF14.1“
- `emitMessage (const char *msg) :`
To print a message into the PowerFactory Output Window
